

AvioFuel

Fuel & Payload Calculator

For light jets and turboprops

Madrid - May 1, 2015

AvioFuel is a Fuel & Payload calculator for the iPhone, designed for light jets and small turbine aircraft.

It provides an intuitive interface for performing quick fuel calculations in any standard units, showing balanced loads for each tank based on the current fuel on board and desired block fuel.

It also allows the pilot to test different Payload/Fuel configurations for the flight, based on the aircraft's structural limits, with dynamically calculated max payload and fuel weights for the current condition. If an overweight situation is detected, a warning message shows the compromised structural limit, as well as the exceeded quantity.

The app includes an editable aircraft database, which ships by default with several well-known jets and turboprops, and it's easily customizable by the user, allowing him to enter custom aircraft profiles.

Designed for iOS 7/8 and optimized for the whole iPhone family, including the latest iPhone 6 and 6 Plus.
